Each gland produces specific hormones that regulate processes such as metabolism, growth, reproduction, and stress responses.

Mechanisms of Hormone Action

Hormones can act through different mechanisms depending on their chemical nature:

- **Peptide hormones** bind to receptors on the cell membrane, triggering second messenger pathways.
- **Steroid hormones** pass through cell membranes and bind to intracellular receptors, influencing gene expression.
- **Amine hormones**, such as thyroid hormones and adrenaline, have varied mechanisms based on their structure.

Understanding these mechanisms is crucial for interpreting PhysioEx experiments where hormone-receptor interactions are simulated.

Feedback Loops and Regulation

Endocrine functions are tightly regulated by feedback mechanisms:

- **Negative feedback** maintains homeostasis by reducing hormone secretion when levels are sufficient.
