Common Heat Transfer Problems and Their Solutions

Below, we explore typical exam problems and detailed solutions to illustrate the problem-solving process.

Problem 1: Heat Conduction through a Wall

Problem Statement:

A 0.2 m thick wall made of brick (thermal conductivity $k = 0.72 \text{ W/m}\cdot\text{K}$) separates two rooms. The indoor temperature is 20°C , and the outdoor temperature is 0°C . Calculate the heat transfer rate through a $10 \text{ m} \times 5 \text{ m}$ section of the wall.

Solution:

Step 1: Given data

- Thickness (L) = 0.2 m
- Area (A) = $10 \text{ m} \times 5 \text{ m} = 50 \text{ m}^2$
- Indoor temperature (T_1) = 20°C
- Outdoor temperature (T_2) = 0°C
- Thermal conductivity (k) = $0.72 \text{ W/m}\cdot\text{K}$

Step 2: Use Fourier's law of conduction

$\backslash$

$$Q = \frac{k \times A \times (T_1 - T_2)}{L}$$

$\backslash$

Step 3: Substitute known values

$\backslash$

$$Q = \frac{0.72 \times 50 \times (20 - 0)}{0.2} = \frac{0.72 \times 50 \times 20}{0.2}$$

$\backslash$

Step 4: Calculate numerator and denominator

$\backslash$

$$Q = \frac{0.72 \times 50 \times 20}{0.2} = \frac{720}{0.2} = 3600 \text{ W}$$

$\backslash$

Final Answer:

The heat transfer rate through the wall is 3600 Watts.

Problem 2: Convective Heat Loss from a Hot Sphere

Problem Statement:

A sphere of radius 0.1 m is maintained at a temperature of 80°C in air at 25°C. The convective heat transfer coefficient (h) is 25 W/m²·K. Determine the rate of heat loss from the sphere.

Solution:

Step 1: Known data

- Radius (r) = 0.1 m
- Surface area $(A = 4\pi r^2)$
- Surface temperature $(T_s = 80^\circ\text{C})$
- Ambient temperature $(T_\infty = 25^\circ\text{C})$
- $(h = 25, \text{ W/m}^2\cdot\text{K})$

Step 2: Calculate surface area

$\{$

$$A = 4\pi (0.1)^2 \approx 4 \times 3.1416 \times 0.01 \approx 0.1257, \text{ m}^2$$

$\}$

Step 3: Apply Newton's law of cooling

$\{$

$$Q = h \times A \times (T_s - T_\infty)$$

$\}$

Step 4: Calculate temperature difference

$\{$

$$\Delta T = 80 - 25 = 55^\circ\text{C}$$

\]

Step 5: Compute heat loss

\[

$$Q = 25 \times 0.1257 \times 55 \approx 25 \times 6.9135 \approx 172.84, \text{ W}$$

\]

Final Answer:

The sphere loses approximately 173 Watts of heat via convection.

Important Formulas and Their Application

Understanding and memorizing key formulas are vital for exam success. Here are some essential equations:

\]

Where:

- ϵ = emissivity (dimensionless)
- σ = Stefan-Boltzmann constant ($5.67 \times 10^{-8} \text{ W/m}^2\cdot\text{K}^4$)

Heat transfer final exam solution: A comprehensive guide to mastering core concepts and problem-solving techniques

Understanding heat transfer is fundamental for engineering students and professionals aiming to analyze thermal systems effectively. When preparing for a final exam, students often seek detailed solutions to reinforce their knowledge, clarify complex topics, and develop problem-solving skills. This article provides an in-depth exploration of typical heat transfer final exam solutions, demystifying core concepts, common question types, and practical approaches to solving them with clarity and precision.

Introduction to Heat Transfer and Its Significance

Heat transfer refers to the movement of thermal energy from one physical system to another due to a temperature difference. It encompasses three primary mechanisms:

- Conduction: Transfer of heat through solid materials via molecular vibrations.
- Convection: Heat transfer involving fluid motion, either natural or forced.

- Radiation: Emission or absorption of electromagnetic waves, primarily in the infrared spectrum.

Mastering these mechanisms is crucial for designing efficient thermal systems, such as heat exchangers, insulation, and cooling systems. Final exams often test students' understanding through a variety of problems ranging from conceptual questions to complex numerical calculations.

Common Types of Questions in Heat Transfer Final Exams

To effectively prepare, students should familiarize themselves with the typical question formats and their solutions. Here are the most common types:

- Conduction Problems

These involve calculating heat transfer rates through solid materials, often using Fourier's law.

- Convection Problems

Questions may focus on determining heat transfer coefficients, Nusselt numbers, or heat transfer rates involving fluid flow.

- Radiation Problems

These typically require understanding emissivity, view factors, and applying the Stefan-Boltzmann law.

- Combined Heat Transfer Problems

Complex questions integrate conduction, convection, and radiation, requiring a step-by-step approach.

Deep Dive into Conduction Problem Solutions

Sample Problem:

Calculate the rate of heat transfer through a 10 cm thick wall made of concrete, with an area of 5 m², if the inside temperature is 20°C and the outside temperature is 0°C. The thermal conductivity of concrete is 1.7 W/m·K.

Solution Steps:

- Identify known data:

- Thickness, $(L = 0.10, \text{ m})$
- Area, $(A = 5, \text{ m}^2)$
- Temperature difference, $(\Delta T = T_{\text{inside}} - T_{\text{outside}} = 20^\circ\text{C} - 0^\circ\text{C} = 20^\circ\text{C})$
- Thermal conductivity, $(k = 1.7, \text{ W/m}\cdot\text{K})$

- Apply Fourier's Law:

$\{$

$$Q = -kA \frac{dT}{dx}$$

$\}$

Since the temperature gradient is linear:

$\{$

$$Q = \frac{kA \Delta T}{L}$$

$\}$

- Calculate:

$\{$

$$Q = \frac{1.7 \times 5 \times 20}{0.10} = \frac{170}{0.10} = 1700, \text{ W}$$

$\}$

Result: The heat transfer rate is 1700 Watts.

This straightforward example exemplifies the typical conduction calculation ? understanding the law, identifying parameters, and applying the formula correctly.

Navigating Convection Problems with Precision

Sample Problem:

A vertical plate with a height of 2 meters and a width of 1 meter is heated to 80°C. The ambient air at 25°C flows over the plate at 2 m/s. The properties of air at this temperature are:

- Kinematic viscosity, $\nu = 15.89 \times 10^{-6} \text{ m}^2/\text{s}$
- Thermal conductivity, $k = 0.0257 \text{ W/m}\cdot\text{K}$
- Prandtl number, $Pr = 0.707$

Determine the heat transfer coefficient h and the heat transfer rate Q . Assume natural convection is negligible, and use appropriate correlations.

Solution Approach:

- Calculate the Reynolds number:

$$\text{Re}_x = \frac{V \times x}{\nu}$$

$$\text{Re}_x = \frac{2 \text{ m/s} \times 2 \text{ m}}{15.89 \times 10^{-6} \text{ m}^2/\text{s}} \approx 251,591$$

$$\text{Re}_x = \frac{2 \text{ m/s} \times 2 \text{ m}}{15.89 \times 10^{-6} \text{ m}^2/\text{s}} \approx 251,591$$

where x is the characteristic length (height of the plate).

$$\text{Re}_x = \frac{2 \text{ m/s} \times 2 \text{ m}}{15.89 \times 10^{-6} \text{ m}^2/\text{s}} \approx 251,591$$

$$\text{Re}_x = \frac{2 \text{ m/s} \times 2 \text{ m}}{15.89 \times 10^{-6} \text{ m}^2/\text{s}} \approx 251,591$$

$$\text{Re}_x = \frac{2 \text{ m/s} \times 2 \text{ m}}{15.89 \times 10^{-6} \text{ m}^2/\text{s}} \approx 251,591$$

- Determine the flow regime:

Since $\text{Re}_x > 5 \times 10^5$, the flow is turbulent along the plate.

- Find the Nusselt number Nu_x :

For turbulent flow over a vertical plate, the Churchill and Bernstein correlation is often used:

[

$$Nu_x = 0.3 + \frac{0.62 Re_x^{1/2} Pr^{1/3}}{\left[1 + (0.4/Pr)^{2/3}\right]^{1/4}} \times \left[1 + \left(\frac{Re_x}{282,000}\right)^{5/8}\right]^{4/5}$$

]

Plugging in the values yields an approximate (Nu_x) .

- Calculate (h) :

[

$$h = \frac{Nu_x \times k}{x}$$

]

- Determine heat transfer rate:

[

$$Q = h \times A \times (T_{\text{plate}} - T_{\text{ambient}})$$

]

where

[

$$A = 2\text{ m} \times 1\text{ m} = 2\text{ m}^2$$

]

and

[

$$\Delta T = 80 - 25 = 55^{\circ}\text{C}$$

\\

Key learning: Correctly identifying flow regime and applying the proper correlation is essential for accurate convection calculations.

Radiation Heat Transfer: Critical Concepts and Calculation Techniques

Radiation problems often involve calculating the heat exchange between surfaces, considering emissivity, view factors, and the Stefan-Boltzmann law.

Example:

Two large parallel plates, each with an emissivity of 0.8, are 2 meters apart. The plates are black surfaces at 600°C and 300°C , respectively. Determine the net radiative heat transfer.

Solution outline:

- Calculate the radiative heat exchange between black surfaces:

\\

$$Q_{\text{net}} = \sigma \times A \times (T_1^4 - T_2^4)$$

\\

where

- $(\sigma = 5.67 \times 10^{-8} \text{ W/m}^2 \cdot \text{K}^4)$

- Temperatures in Kelvin:

\\

$$T_1 = 600 + 273 = 873 \text{ K}$$

\\

\[

$$T_2 = 300 + 273 = 573 \text{ K}$$

\]

- Adjust for emissivity:

Since surfaces are not black,

\[

$$Q_{\text{net}} = \frac{\sigma}{\frac{1}{\epsilon_1} + \frac{1}{\epsilon_2} - 1} \times A \times (T_1^4 - T_2^4)$$

\]

with $(\epsilon_1 = \epsilon_2 = 0.8)$.

- Calculate and interpret the result:

This provides the net radiative heat transfer rate, an essential step in thermal design involving radiative exchange.

Integrating Multiple Modes: Combined Heat Transfer Solutions

In real-world applications, heat transfer rarely occurs via a single mechanism. Final exam questions often challenge students to analyze combined conduction, convection, and radiation.

Approach to solving combined problems:

- Break down the system into segments or mechanisms.
- Calculate individual heat transfer rates.
- Apply energy balance principles to determine the overall heat transfer rate.
- Use iterative or numerical methods when necessary, especially in complex geometries.

Example:

Design a thermal insulation system where heat transfer occurs through conduction within the insulator, convection at the outer surface, and radiation from the outer surface to the surroundings. Determine the overall heat transfer rate considering all mechanisms.

Key steps:

- Calculate conduction resistance of the insulator.
- Determine convection heat transfer coefficient based on the external environment.
- Compute radiative exchange with the surroundings, considering emissivity and view factors.
- Combine resistances or heat transfer rates to find the total heat transfer.

Practical Tips for Final Exam Success

- Understand the fundamentals: Know the governing laws and their physical significance.
- Identify the problem type quickly: Conduction, convection, radiation, or a combination.
- Select appropriate correlations: Use the correct empirical formulas based on flow regimes and conditions.
- Organize your calculations: Break complex problems into manageable steps.
- Check units and magnitudes: Ensure consistency and plausibility of results.
- Practice past exam problems: Familiarity improves problem-solving speed and confidence.
