## Sample Networking Exam Questions and Answers at Mansoura University

To aid in effective preparation, here are some typical exam questions along with their detailed

answers.

### **Question 1: Explain the OSI Model and its seven layers.**

Answer:

The OSI (Open Systems Interconnection) Model is a conceptual framework that standardizes the functions of a telecommunication or computing system into seven distinct layers. Each layer has specific responsibilities and communicates with the layers directly above and below it.

Layers:

- Physical Layer: Handles the physical connection, transmission of raw bits over a medium (e.g., cables, switches).
- Data Link Layer: Manages node-to-node data transfer, error detection, and MAC addressing.
- Network Layer: Responsible for routing, addressing (IP), and packet forwarding.
- Transport Layer: Ensures reliable data transfer (TCP) or connectionless transmission (UDP).
- Session Layer: Manages sessions between applications.
- Presentation Layer: Data translation, encryption, and compression.
- Application Layer: Provides network services directly to end-user applications (e.g., HTTP, FTP).

Understanding these layers helps in troubleshooting and designing networks effectively.

### **Question 2: What is subnetting, and why is it used?**

Answer:

Subnetting is the process of dividing a larger network into smaller, manageable subnetworks or subnets. It involves modifying the subnet mask to create multiple logical networks within a single IP network.

Reasons for subnetting:

- Improve network performance by reducing broadcast domains.
- Enhance security by isolating segments.
- Efficient IP address utilization, especially with IPv4 address shortages.
- Simplify network management.

Example:

Given IP 192.168.1.0/24, subnetting can create subnets like 192.168.1.0/26, 192.168.1.64/26, etc., each with a specific range of addresses.

Question 3: Differentiate between TCP and UDP protocols.

Answer:

| Feature        | TCP (Transmission Control Protocol)                                | UDP (User Datagram Protocol)                    |
|----------------|--------------------------------------------------------------------|-------------------------------------------------|
| Connection     | Connection-oriented; establishes a connection before data transfer | Connectionless; no connection setup             |
| Reliability    | Ensures reliable delivery via acknowledgments and retransmissions  | No guarantee of delivery; faster but unreliable |
| Data Integrity | Checks for errors; retransmits lost packets                        | Minimal error checking                          |
| Use Cases      | Web browsing, email, file transfer                                 | Streaming, online gaming, VoIP                  |
| Overhead       | Higher due to connection management                                | Lower, suitable for real-time applications      |

Choosing between TCP and UDP depends on application requirements for reliability and speed.

# Common Networking Exam Questions at Mansoura University

Exam questions tend to target core areas while also challenging students to think critically. Below are several representative questions categorized by topic, with detailed answers and explanations.

## 2.1 OSI and TCP/IP Models

Q1: Describe the seven layers of the OSI model and their primary functions.

Answer:

- Physical Layer: Transmits raw bitstreams over physical medium; handles electrical and mechanical aspects.
- Data Link Layer: Provides node-to-node data transfer, error detection, and MAC addressing.
- Network Layer: Manages routing, logical addressing (IP), and packet forwarding.
- Transport Layer: Ensures complete data transfer, reliability, flow control (TCP/UDP).
- Session Layer: Manages sessions between applications, establishing, maintaining, and terminating connections.
- Presentation Layer: Handles data translation, encryption, compression, and format translation.
- Application Layer: Interface for end-user applications; protocols like HTTP, FTP operate here.

This layered approach simplifies troubleshooting and protocol design.

Q2: Compare the OSI model with the TCP/IP model. Highlight similarities and differences.

Answer:

| Aspect           | OSI Model                                                                         | TCP/IP Model                                        |
|------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------|
| -----            | -----                                                                             | -----                                               |
| Number of Layers | 7                                                                                 | 4 or 5 (depending on interpretation)                |

| Similarities     | Both use layered architecture; facilitate interoperability   Both address similar |                                                     |

functions, e.g., routing, data transfer |

| Differences | OSI is more theoretical; TCP/IP is protocol-based | OSI separates presentation/session; TCP/IP combines these |

Understanding these models aids in network design and troubleshooting.

## 2.2 Networking Protocols

Q3: Explain the role of DNS in network communication.

Answer:

The Domain Name System (DNS) acts as the phonebook of the internet. It translates human-readable domain names (e.g., `www.mansoura.edu`) into IP addresses (e.g., `192.168.1.1`), enabling browsers and applications to locate servers on the network. DNS operates through a distributed hierarchy of servers, including root servers, TLD servers, and authoritative servers. When a user requests a website, the DNS resolver queries these servers to resolve the domain name, ensuring seamless access to resources without memorizing IP addresses.

Q4: What is the difference between TCP and UDP?

Answer:

- TCP (Transmission Control Protocol): Connection-oriented, reliable, ensures data delivery, ordered, performs error checking and correction. Suitable for applications like web browsing, email.
- UDP (User Datagram Protocol): Connectionless, faster, does not guarantee delivery, no error correction, suitable for streaming, online gaming, where speed is prioritized over reliability.

Choosing between TCP and UDP depends on application requirements.

## 2.3 IP Addressing and Subnetting

Q5: How do you determine the number of hosts in a subnet given a subnet mask?

Answer:

The number of hosts in a subnet is calculated using the formula:

Number of Hosts =  $(2^{\text{Number of Host Bits}}) - 2$

The subtraction of 2 accounts for the network address and broadcast address, which cannot be assigned to hosts.

For example, with a subnet mask of 255.255.255.240 (/28):

- Host bits: 4 (since  $32 - 28 = 4$ )
- Number of hosts:  $(2^4) - 2 = 16 - 2 = 14$

Therefore, this subnet can support 14 hosts.

## 2.4 Network Security and Devices

Q6: What functions does a firewall perform in a network?

Answer:

A firewall acts as a security barrier between a trusted internal network and untrusted external networks (like the internet). Its primary functions include:

- Packet filtering: Examines packets based on source/destination IP, port, or protocol.
- Stateful inspection: Tracks active connections and allows only legitimate packets.
- Proxy services: Acts as an intermediary for requests.
- Content filtering: Blocks access to certain websites or content.
- Logging and alerts: Monitors traffic for suspicious activity.

Firewalls are crucial in defending networks against unauthorized access, malware, and cyber threats.
