appropriate initial treatment?

- A. Thrombolytic therapy within 4.5 hours of symptom onset
- B. Aspirin therapy
- C. Mechanical thrombectomy
- D. Corticosteroids

Answer: A. Thrombolytic therapy within 4.5 hours of symptom onset

Rationale: The patient exhibits signs consistent with an ischemic stroke. Thrombolytics (e.g., tPA) are indicated within the therapeutic window, provided no contraindications. Aspirin may be used after stabilization but is not the initial treatment if within the window. Mechanical thrombectomy is an option for large vessel occlusions but depends on time and facility capabilities. Corticosteroids are not indicated.
