Fundamental Concepts in Irrigation Engineering

Understanding the basic concepts is essential for designing effective irrigation systems. Some key principles include:

1. Water Requirement of Crops

- Determined based on crop type, growth stage, climate, and soil conditions.
- Expressed as crop water requirement (CWR), which guides the volume of water needed.

2. Duty of Water

- Represents the area that a unit quantity of water can irrigate in a given period.
- Typically expressed in hectares per cubic meter (ha/m³).

3. Fall and Head

- Fall: The vertical distance water drops in the system.
- Head: The energy possessed by water due to elevation and velocity.

4. Uniformity of Distribution

- Ensures water is evenly distributed across the irrigated area.
- Critical for preventing waterlogging and ensuring crop health.

Types of Irrigation Systems

Irrigation systems are broadly classified based on their methods of water application and distribution. Each type serves specific needs and environmental conditions.

1. Surface Irrigation

- Water flows over the soil surface by gravity.
- Includes methods like basin, border, furrow, and border strip irrigation.
- Advantages: Simple, low cost.

- Suitable for high-value crops and areas with limited water supply.

3. Sprinkler Irrigation

- Mimics natural rainfall by spraying water through nozzles.
- Suitable for uneven terrains and fields where surface irrigation is challenging.
- Variants include center pivot, lateral move, and portable systems.

4. Subsurface Irrigation

- Water is supplied below the soil surface via buried pipes or emitters.
- Reduces evaporation losses.
- Ideal for sensitive crops and areas with high evaporation rates.

Design Principles of Irrigation Systems

Designing an effective irrigation system involves meticulous planning and calculations to ensure efficiency, sustainability, and cost-effectiveness. SK Garg emphasizes the following aspects:

1. Estimation of Water Requirements

- Based on crop water needs, soil type, climatic conditions.
- Uses formulas like $CWR = ETo \times Kc$, where ETo is reference evapotranspiration and Kc is crop coefficient.

2. Selection of Appropriate System

- Depends on land topography, crop type, water availability, and economic factors.
- For example, drip irrigation for high-value crops, surface irrigation for large fields.

3. Hydraulic Design

- Ensuring proper flow velocities, pipe sizes, and pressure.
- Avoiding issues like waterlogging, erosion, or insufficient supply.

4. Layout Planning

- Positioning of main and distribution channels.
- Designing laterals and outlets for uniform water distribution.
