Practice questions about the Bohr model are essential for students and chemistry enthusiasts aiming to deepen their understanding of atomic structure. The Bohr model, introduced by Niels Bohr in 1913, revolutionized atomic theory by proposing that electrons orbit the nucleus in specific, quantized energy levels. Mastering practice questions about the Bohr model helps learners grasp key concepts such as electron transitions, energy calculations, and atomic spectra. In this comprehensive guide, we will explore a variety of practice questions on the Bohr model, their solutions, and tips for mastering this fundamental topic in chemistry.

Understanding the Basics of the Bohr Model

Before diving into practice questions, it's important to understand the foundational principles of the Bohr model.

Key Concepts

- **Quantized Energy Levels:** Electrons occupy specific energy levels or orbits around the nucleus, labeled $n=1, 2, 3$, etc.
- **Electron Transitions:** Electrons can move between energy levels by absorbing or emitting precise amounts of energy in the form of photons.
- **Hydrogen Spectrum:** The model successfully explains the spectral lines of the hydrogen atom through electron transitions between energy levels.

Important Equations

- **Energy of a level:** $E_n = -\frac{13.6}{n^2} \text{ eV}$ for hydrogen
- **Energy of a photon emitted or absorbed:** $\Delta E = E_{\text{final}} - E_{\text{initial}}$
- **Wavelength of emitted or absorbed photon:** $\lambda = \frac{hc}{\Delta E}$, where h is Planck's constant and c is the speed of light.

Practice Questions About the Bohr Model

To solidify your understanding, here are some practice questions covering various aspects of the Bohr model, accompanied by detailed solutions.

Question 1: Basic Energy Level Calculation

What is the energy (in electron volts) of an electron in the second energy level ($n=2$) of a hydrogen atom?

Solution:

Using the formula $E_n = -\frac{13.6 \text{ eV}}{n^2}$,

- For $n=2$:

$\{$

$$E_2 = -\frac{13.6 \text{ eV}}{2^2} = -\frac{13.6 \text{ eV}}{4} = -3.4 \text{ eV}$$

$\}$

The negative sign indicates the bound state, so the energy of an electron in the second energy level is -3.4 eV.

Question 2: Electron Transition and Photon Emission

When an electron in a hydrogen atom drops from the $n=3$ level to the $n=2$ level, what is the wavelength of the emitted photon?

Solution:

- Calculate the energy difference:

$\{$

$$E_3 = -\frac{13.6 \text{ eV}}{3^2} = -\frac{13.6 \text{ eV}}{9} \approx -1.51 \text{ eV}$$

$\}$

$\{$

$$E_2 = -3.4 \text{ eV}$$

\]

- Find ΔE :

\[

$$\Delta E = E_2 - E_3 = -3.4 - (-1.51) = -3.4 + 1.51 = -1.89 \text{ eV}$$

\]

The negative sign indicates emission; energy emitted is 1.89 eV.

- Convert this energy to wavelength:

\[

$$\lambda = \frac{hc}{\Delta E}$$

\]

With $(h = 4.1357 \times 10^{-15} \text{ eV}\cdot\text{s})$, and $(c = 3.0 \times 10^8 \text{ m/s})$,

\[

$$\lambda = \frac{(4.1357 \times 10^{-15})(3.0 \times 10^8)}{1.89} \approx \frac{1.24 \times 10^{-6}}{1.89} \approx 656 \text{ nm}$$

\]

Answer: The wavelength of the emitted photon is approximately 656 nm, which corresponds to red light.

Question 3: Hydrogen Atom in Different Energy Levels

What is the energy of the photon emitted when an electron transitions from $n=4$ to $n=1$ in a hydrogen atom?

Solution:

- Find the energies:

\[

$$E_4 = -\frac{13.6}{4^2} = -\frac{13.6}{16} = -0.85 \text{ eV}$$

\]

\[

$$E_1 = -13.6 \text{ eV}$$

\]

- Calculate ΔE :

\[

$$\Delta E = E_1 - E_4 = -13.6 - (-0.85) = -13.6 + 0.85 = -12.75 \text{ eV}$$

\]

- The photon emitted has energy of 12.75 eV.

Additional tip: To find the wavelength, use the same formula as above.

Question 4: Determining the Energy Levels from Wavelengths

If a spectral line of hydrogen appears at a wavelength of 486.1 nm, between which energy levels does the electron transition occur?

Solution:

- Convert wavelength to energy:

\[

$$\Delta E = \frac{hc}{\lambda}$$

\]

\[

$$\Delta E = \frac{(4.1357 \times 10^{-15})(3.0 \times 10^8)}{486.1 \times 10^{-9}} \approx 2.56 \text{ eV}$$

\]

- Now, find the initial and final levels:

$$\text{Since } E_n = -\frac{13.6}{n^2},$$

Let's assume the transition is from level n to m , with E_m and E_n ,

\[

$$\Delta E = E_m - E_n = 2.56 \text{ eV}$$

\]

Because the energy increases from initial to final (emission), the initial level is higher.

Let's try $n=4$:

\[

$$E_4 = -\frac{13.6}{16} = -0.85 \text{ eV}$$

\]

To get $\Delta E = 2.56 \text{ eV}$,

\[

$$E_m = E_n + 2.56$$

\]

\[

$$E_m = -0.85 + 2.56 = 1.71 \text{ eV}$$

]

Since (E_m) must be negative or zero, this suggests the transition is from $n=4$ to $n=2$:

[

$$E_2 = -3.4 \text{ eV}$$

]

[

$$\Delta E = E_2 - E_4 = -3.4 - (-0.85) = -2.55 \text{ eV}$$

]

The magnitude matches the calculated energy (2.56 eV), confirming the transition is from $n=4$ to $n=2$.

Answer: The electron transitions from $n=4$ to $n=2$.

Core Themes Covered in Practice Questions About the Bohr Model

Practice questions about the Bohr model typically revolve around several core themes that encapsulate its fundamental principles:

- Electron Energy Levels and Quantization
- Electron Transitions and Spectral Lines
- Calculations Involving Energy, Frequency, and Wavelength
- Ionization and Electron Removal
- Limitations and Extensions of the Bohr Model

Let's explore each theme in detail, along with example questions and strategies for solving them.

1. Electron Energy Levels and Quantization

Understanding the concept:

The Bohr model posits that electrons orbit the nucleus at specific, quantized energy levels characterized by principal quantum numbers ($n=1, 2, 3, \dots$). Electrons can transition between these levels by absorbing or emitting precise quanta of energy.

Typical practice questions include:

- What is the energy of an electron in the $n=3$ level of a hydrogen atom?
- How does the energy of an electron change when it moves from $n=4$ to $n=2$?
- Calculate the energy difference between two levels in a hydrogen atom.

Problem-solving approach:

Use the Bohr energy formula:

$$E_n = -\frac{13.6}{n^2} \text{ eV}$$

where 13.6 eV is the ionization energy of hydrogen.

Example question:

Calculate the energy of an electron in the $n=4$ level.

Solution:

$$E_4 = -\frac{13.6 \text{ eV}}{4^2} = -\frac{13.6}{16} = -0.85 \text{ eV}$$

This negative value indicates the electron is bound within the atom.

2. Electron Transitions and Spectral Lines

Understanding the concept:

When electrons transition between energy levels, they emit or absorb photons with energies corresponding to the difference between the levels. These transitions produce spectral lines, like the Balmer series in hydrogen.

Typical practice questions include:

- What wavelength of light is emitted when an electron transitions from $n=3$ to $n=2$ in hydrogen?
- Determine the frequency of the photon emitted during a transition from $n=5$ to $n=3$.
- Identify whether the transition from $n=4$ to $n=1$ results in absorption or emission.

Problem-solving approach:

Calculate the energy difference using:

$$\Delta E = E_{n_f} - E_{n_i}$$

and then relate it to wavelength (λ), frequency (f), or photon energy.

The relation between photon energy and wavelength:

$$E = hf = \frac{hc}{\lambda}$$

where:

- ($h = 6.626 \times 10^{-34} \text{ Js}$) (Planck's constant)

- $(c = 3.00 \times 10^8 \text{ m/s})$ (speed of light)

Example question:

Calculate the wavelength of the photon emitted during the transition from $n=3$ to $n=2$ in hydrogen.

Solution:

- Find (E_3) and (E_2) :

$$E_3 = -\frac{13.6}{9} = -1.51 \text{ eV}$$

$$E_2 = -\frac{13.6}{4} = -3.4 \text{ eV}$$

- Calculate (ΔE) :

$$\Delta E = E_2 - E_3 = (-3.4) - (-1.51) = -1.89 \text{ eV}$$

Since energy emitted is positive, take the absolute value:

$$E_{\text{photon}} = 1.89 \text{ eV}$$

- Convert eV to Joules:

$$1 \text{ eV} = 1.602 \times 10^{-19} \text{ J}$$

$$E_{\text{photon}} = 1.89 \times 1.602 \times 10^{-19} \approx 3.03 \times 10^{-19} \text{ J}$$

- Find wavelength:

$$\lambda = \frac{hc}{E} = \frac{(6.626 \times 10^{-34})(3.00 \times 10^8)}{3.03 \times 10^{-19}} \approx 6.56 \times 10^{-7} \text{ m}$$

or approximately 656 nm, which corresponds to the red Balmer line.

3. Calculations Involving Energy, Frequency, and Wavelength

Understanding the interrelations:

Practice questions often require converting between energy, frequency, and wavelength, reinforcing understanding of electromagnetic radiation and atomic transitions.

Common question types:

- Determine the frequency of a photon with a given wavelength.
- Calculate the energy of a photon emitted during a specific electronic transition.
- Find the wavelength associated with a given photon energy.

Approach:

Use the fundamental relations:

$$E = h f$$

$$c = \lambda f$$

and rearranged as needed.

Example question:

A photon has a wavelength of 500 nm. What is its energy?

Solution:

- Convert wavelength to meters:

$$\lambda = 500 \text{ nm} = 5.00 \times 10^{-7} \text{ m}$$

- Calculate frequency:

$$f = \frac{c}{\lambda} = \frac{3.00 \times 10^8}{5.00 \times 10^{-7}} = 6.00 \times 10^{14} \text{ Hz}$$

- Calculate energy:

$$E = hf = (6.626 \times 10^{-34})(6.00 \times 10^{14}) \approx 3.98 \times 10^{-19}, \text{ J}$$

or in eV:

$$E = \frac{3.98 \times 10^{-19}}{1.602 \times 10^{-19}} \approx 2.48, \text{ eV}$$

4. Ionization and Electron Removal

Understanding the concept:

The Bohr model also addresses ionization energy?the energy required to remove an electron from an atom in a specific energy level.

Practice questions include:

- What is the ionization energy of hydrogen from the $n=1$ level?
- Calculate the energy needed to ionize a hydrogen atom from $n=3$.
- Determine the minimum energy required to strip an electron from the $n=2$ level.

Approach:

Use the energy difference between the energy level and the ionization continuum ($n \rightarrow \infty$):

$$E_{\text{ionization}} = -E_n$$

since the energy at $n \rightarrow \infty$ is zero.

Example question:

Calculate the ionization energy of hydrogen from the $n=3$ level.

Solution:

$$E_3 = -\frac{13.6}{9} = -1.51, \text{ eV}$$

Ionization energy:

$$E_{\text{ionization}} = 0 - (-1.51, \text{ eV}) = 1.51, \text{ eV}$$

Thus, 1.51 eV of energy is required to ionize hydrogen from $n=3$.

5. Limitations and Extensions of the Bohr Model

Understanding the scope:

Question What does the Bohr model of the atom primarily depict? The Bohr model depicts the atom as a nucleus surrounded by electrons orbiting in fixed, quantized energy levels or shells. How does the Bohr model explain the emission spectra of hydrogen? The Bohr model explains hydrogen's emission spectra by stating that electrons jump between fixed energy levels, emitting photons with specific wavelengths when they fall to lower levels. What is the significance of the quantized energy levels in the Bohr model? Quantized energy levels mean electrons can only occupy certain allowed energies, which explains the discrete lines observed in atomic spectra. What are some limitations of the Bohr model? The Bohr model does not accurately describe atoms with more than one electron, fails to account for electron spin and wave-particle duality, and does not fully explain spectral fine structures. How can practice questions about the Bohr model help students understand atomic structure? Practice questions reinforce understanding of electron energy levels, spectral emissions, and the limitations of the model, aiding in conceptual clarity and exam preparedness. What type of questions are commonly asked about the Bohr model in exams? Common questions include calculating energy differences between levels, explaining spectral lines, describing the model's assumptions, and comparing it with modern atomic theory.
