Providing concrete examples clarifies the application of concepts.

Example 1: Converting Units in a Distance Problem

Problem: A car travels 150 miles at a speed of 60 miles per hour. Convert the distance to kilometers and the speed to meters per second.

Solution:

- Use conversion factors:
- 1 mile = 1.60934 km
- 1 mile = 1609.34 meters
- 1 hour = 3600 seconds

- Distance in km:

\[

$$150 \text{ miles} \times 1.60934 \frac{\text{km}}{\text{mile}} = 241.401 \text{ km}$$

\]

- Speed in m/s:

\[

$$60 \frac{\text{miles}}{\text{hour}} \times 1609.34 \frac{\text{meters}}{\text{mile}} \div 3600 \text{ seconds} = \frac{60 \times 1609.34}{3600} \approx 26.82 \text{ m/s}$$

\]

Answer: The car traveled approximately 241.4 km at a speed of 26.82 m/s.

Example 2: Coordinate Transformation from Cartesian to Polar

Problem: Find the polar coordinates (r, θ) of point $P(3, 3)$.

Solution:

- Calculate r :

[

$$r = \sqrt{x^2 + y^2} = \sqrt{3^2 + 3^2} = \sqrt{9 + 9} = \sqrt{18} \approx 4.24$$

]

- Calculate θ :

[

$$\theta = \arctan \left(\frac{y}{x} \right) = \arctan(1) = 45^\circ \text{ or } \frac{\pi}{4} \text{ radians}$$

]

Answer: The polar coordinates are approximately (4.24, 45°) or (4.24, $\frac{\pi}{4}$) radians.
