Intermediate microeconomics formula sheet is an essential resource for students and professionals aiming to grasp the core mathematical tools used in analyzing consumer behavior, production, market structures, and welfare economics. A well-organized formula sheet simplifies complex concepts, aids in quick revision, and enhances problem-solving efficiency. This comprehensive guide provides a detailed overview of the key formulas encountered in intermediate microeconomics, structured to support learners at various levels.

Understanding Consumer Theory Formulas

Consumer theory forms the foundation of microeconomics, analyzing how consumers make choices to maximize utility given their budget constraints. Here are the critical formulas.

Budget Constraint

The budget constraint describes the combinations of goods a consumer can afford:

$\{$

$$p_x x + p_y y = I$$

$\}$

where:

- (p_x, p_y) = prices of goods X and Y
- (x, y) = quantities of goods X and Y
- (I) = consumer's income

Utility Functions

Consumer preferences are represented through utility functions:

$\{$

$$U = U(x, y)$$

\]

Common forms include:

- Cobb-Douglas: $U(x, y) = x^a y^b$
- Perfect substitutes: $U(x, y) = a x + b y$
- Perfect complements: $U(x, y) = \min\{a x, b y\}$

Marginal Utility and Marginal Rate of Substitution (MRS)

- Marginal Utility (MU):

\[

$$MU_x = \frac{\partial U}{\partial x}, \quad MU_y = \frac{\partial U}{\partial y}$$

\]

- Marginal Rate of Substitution:

\[

$$MRS_{xy} = - \frac{MU_x}{MU_y}$$

\]

This indicates how much of good Y a consumer is willing to give up to gain one more unit of good X while maintaining the same utility.

Consumer Equilibrium Condition

Maximizing utility subject to the budget constraint yields:

\[

$$\frac{MU_x}{p_x} = \frac{MU_y}{p_y}$$

$$\frac{1}{p_x}$$

or equivalently:

$$\frac{1}{p_y}$$

$$MRS_{xy} = \frac{p_x}{p_y}$$

$$\frac{1}{p_x}$$

Production Theory Formulas

Production functions describe how inputs are transformed into outputs. Understanding the related formulas is crucial for analyzing firm behavior.

Production Functions and Total Product (TP)

- General form:

$$Q = f(L, K)$$

$$Q = f(L, K)$$

$$\frac{1}{p_x}$$

where:

- Q = quantity of output
- L = labor input
- K = capital input

Marginal Product (MP)

- Marginal product of labor:

$$\frac{1}{p_x}$$

$$MP_L = \frac{\partial Q}{\partial L}$$

\]

- Marginal product of capital:

\[

$$MP_K = \frac{\partial Q}{\partial K}$$

\]

Average Product (AP)

\[

$$AP_L = \frac{Q}{L}, \quad AP_K = \frac{Q}{K}$$

\]

Isoquants and Marginal Rate of Technical Substitution (MRTS)

- Isoquants are contours representing constant output:

\[

$$Q = c$$

\]

- MRTS between inputs L and K:

\[

$$MRTS_{LK} = - \frac{MP_L}{MP_K}$$

\]

It indicates the rate at which one input can be substituted for another while keeping output constant.

Cost Functions and Cost Minimization

- Total cost:

\[

$$TC = wL + rK$$

\]

where:

- w = wage rate
- r = rental rate of capital
- Cost minimization condition:

\[

$$\frac{MP_L}{w} = \frac{MP_K}{r}$$

\]

Market Structures and Equilibrium Formulas

Understanding different market structures involves analyzing equilibrium conditions, profit maximization, and pricing strategies.

Perfect Competition

- Firm profit maximization:

\[

$$\pi = P \times Q - TC(Q)$$

\]

- Profit-maximizing output:

\[

$$MR = MC$$

\]

where:

- (MR) = marginal revenue

- (MC) = marginal cost

In perfect competition:

\[

$$MR = P$$

\]

Monopoly Pricing

- Revenue function:

\[

$$TR = P(Q) \times Q$$

\]

- Marginal Revenue:

\[

$$MR = \frac{d(TR)}{dQ} = P + Q \frac{dP}{dQ}$$

\]

- Monopoly profit maximization:

\[

$MR = MC$

\]

Oligopoly and Game Theory Models

- Cournot Equilibrium:

\[

$Q_i^* \text{ where } P(Q_1 + Q_2 + \dots + Q_n) \text{ and } Q_i \text{ best response}$

\]

- Bertrand Model:

\[

$P_i = P_j = \text{price competition, often leading to marginal cost pricing}$

Welfare Economics and Efficiency Formulas

Welfare economics assesses how resource allocations impact societal well-being.

Consumer Surplus

\[

$CS = \text{Maximum Willingness to Pay} - \text{Actual Price} \times \text{Quantity}$

\]

Producer Surplus

\[

$$PS = \text{Price} \times \text{Quantity} - \text{Total Variable Cost}$$

\\

Deadweight Loss (DWL)

\\

$$DWL = \frac{1}{2} \times \text{Base} \times \text{Height}$$

\\

represents the loss of efficiency due to market distortions like taxes or monopolies.

Additional Key Formulas

- Elasticity of Demand:

\\

$$E_d = \frac{\partial Q}{\partial P} \times \frac{P}{Q}$$

\\

- Price Elasticity of Supply:

\\

$$E_s = \frac{\partial Q_s}{\partial P} \times \frac{P}{Q_s}$$

\\

- Cross-Price Elasticity:

\\

$$E_{xy} = \frac{\partial Q_x}{\partial P_y} \times \frac{P_y}{Q_x}$$

\\

Intermediate Microeconomics Formula Sheet: A Comprehensive Guide for Students and Enthusiasts

Introduction

In the journey through microeconomics, students often encounter a plethora of formulas that underpin the core concepts of consumer behavior, producer theory, market equilibrium, and game theory. An intermediate microeconomics formula sheet serves as a vital reference, distilling complex mathematical relationships into accessible tools that facilitate analysis and deepen understanding. Whether you're preparing for exams, developing economic models, or simply seeking clarity on the mathematical backbone of microeconomics, having a well-organized formula sheet is indispensable. This article explores the key formulas, concepts, and applications in intermediate microeconomics, providing a detailed yet reader-friendly guide to the essential mathematical tools in the discipline.

The Foundations: Consumer Choice and Utility Maximization

Consumer theory forms the backbone of microeconomic analysis, focusing on how individuals allocate their limited income across various goods to maximize satisfaction.

Budget Constraints

At the core of consumer choice is the budget constraint, which defines the feasible consumption bundle:

Formula:

$$p_1 x_1 + p_2 x_2 \leq I$$

- p_1, p_2 : Prices of goods 1 and 2
- x_1, x_2 : Quantities of goods 1 and 2
- I : Income

The equality holds at the consumer's chosen bundle.

Utility Functions

Consumers derive satisfaction from goods, represented by utility functions:

- Cobb-Douglas Utility:

$$U(x_1, x_2) = x_1^{\alpha} \times x_2^{\beta}$$

- CES (Constant Elasticity of Substitution):

$$U(x_1, x_2) = \left(\delta \times x_1^{\rho} + (1 - \delta) \times x_2^{\rho} \right)^{1/\rho}$$

- Leontief Utility (Perfect Complements):

$$U(x_1, x_2) = \min \left\{ \frac{x_1}{a}, \frac{x_2}{b} \right\}$$

Consumer Optimization

The goal is to maximize utility subject to the budget constraint:

\[

$$\max_{\{x_1, x_2\}} U(x_1, x_2) \quad \text{such that} \quad p_1 x_1 + p_2 x_2 = I$$

\]

Lagrangian Method:

$$\mathcal{L} = U(x_1, x_2) - \lambda (p_1 x_1 + p_2 x_2 - I)$$

First-Order Conditions (FOCs):

\[

$$\frac{\partial \mathcal{L}}{\partial x_1} = \frac{\partial U}{\partial x_1} - \lambda p_1 = 0$$

\]

\[

$$\frac{\partial \mathcal{L}}{\partial x_2} = \frac{\partial U}{\partial x_2} - \lambda p_2 = 0$$

\]

\[

$$\frac{\partial \mathcal{L}}{\partial \lambda} = p_1 x_1 + p_2 x_2 - I = 0$$

\]

Marginal Rate of Substitution (MRS):

\[

$$\text{MRS}_{x_1, x_2} = \frac{\partial U / \partial x_1}{\partial U / \partial x_2} = \frac{p_1}{p_2}$$

\]

This equality ensures optimal consumption by equating MRS to the price ratio.

Demand Functions and Elasticities

Demand functions describe how quantities respond to changes in prices and income.

Marshallian (Ordinary) Demand

Derived from utility maximization:

\[

$$x_1^* = x_1(p_1, p_2, I)$$

\]

\[

$$x_2^* = x_2(p_1, p_2, I)$$

\]

Example: Cobb-Douglas demand:

\[

$$x_1^* = \alpha \frac{I}{p_1}$$

\]

\[

$$x_2^* = \beta \frac{I}{p_2}$$

\]

Price and Income Elasticities

- Price Elasticity of Demand:

\[

$$\epsilon_p = \frac{\partial x}{\partial p} \times \frac{p}{x}$$

\]

- Income Elasticity of Demand:

\[

$$\text{I} \epsilon_x = \frac{\partial x}{\partial I} \times \frac{I}{x}$$

\]

These measure responsiveness of demand to price and income changes.

Producer Theory: Cost, Revenue, and Profit Maximization

Producers aim to maximize profits given production technologies.

Total, Average, and Marginal Cost

- Total Cost (TC):

$$TC(q)$$

- Average Cost (AC):

$$AC(q) = \frac{TC(q)}{q}$$

- Marginal Cost (MC):

$$MC(q) = \frac{dTC}{dq}$$

Revenue and Profit

- Total Revenue (TR):

$$TR = p \times q$$

- Profit (π):

$$\pi(q) = TR - TC(q)$$

Profit Maximization Condition:

[

$$\frac{d\pi}{dq} = p - MC(q) = 0$$

]

or

[

$$p = MC(q)$$

]

indicating that profit is maximized when price equals marginal cost.

Market Equilibrium and Welfare Analysis

Understanding how markets reach equilibrium and the implications for efficiency involves key formulas.

Supply and Demand Equilibrium

Market clears when:

[

$$Q_s(p) = Q_d(p)$$

]

- $Q_s(p)$: Quantity supplied at price p
- $Q_d(p)$: Quantity demanded at price p

The equilibrium price (p^*) satisfies this condition.

Consumer and Producer Surplus

- Consumer Surplus (CS):

[

$$CS = \text{Area between demand curve and market price} = \int_{p^*}^{\infty} Q_d(p) dp - p^* \times Q_d(p^*)$$

]

- Producer Surplus (PS):

[

$$PS = p^* \times Q_s(p^*) - \int_0^{Q_s(p^*)} MC(q) dq$$

]

Total welfare maximization occurs at the equilibrium.

Game Theory and Strategic Interactions

Intermediate microeconomics often examines strategic behavior using game theory.

Nash Equilibrium

In a strategic game with players $(i=1, 2, \dots, n)$:

[

A profile of strategies $(s_1^*, s_2^*, \dots, s_n^*)$ is a Nash Equilibrium if:

]

[

$\forall i, \quad u_i(s_i^*, s_{-i}^*) \geq u_i(s_i, s_{-i}^*) \quad \text{for all } s_i$

$\forall$

where u_i is player i 's payoff, and s_{-i}^* is the strategies of all other players at equilibrium.

Advanced Concepts: Comparative Statics and Welfare Theorems

Comparative Statics

Analyzing how the optimal choices change with parameters:

$\frac{\partial x^*(p, I)}{\partial p} \quad \text{and} \quad \frac{\partial x^*(p, I)}{\partial I}$

$\frac{\partial x^*(p, I)}{\partial p} \quad \text{and} \quad \frac{\partial x^*(p, I)}{\partial I}$

$\forall$

These derivatives guide understanding of demand shifts.

First and Second Welfare Theorems

- First Welfare Theorem: Under certain conditions, competitive equilibrium is Pareto efficient.
- Second Welfare Theorem: Any Pareto efficient allocation can be achieved through market mechanisms with appropriate redistribution.

Practical Tips and Summary

- Always verify assumptions behind each formula.
- Use the Lagrangian method for constrained optimization problems.
- Remember elasticity formulas help predict demand responses.
- In producer theory, set marginal cost equal to price for profit maximization.
- Market equilibrium occurs where supply equals demand, and welfare measures help assess efficiency.
- Game theory concepts are essential for understanding strategic interactions.

Conclusion

An intermediate microeconomics formula sheet consolidates the mathematical essence of

microeconomic analysis, providing a quick reference to facilitate problem-solving and conceptual understanding. From consumer utility maximization to producer optimization, market equilibrium, and strategic interactions, these formulas form the toolkit for analyzing the complex yet fascinating world of individual choices and market dynamics. Mastery of these formulas not only prepares students for exams but also lays a solid foundation for advanced economic research and real-world application. Keep this sheet handy, practice regularly, and deepen your understanding of the economic forces shaping everyday life.

Question What are the key demand and supply elasticity formulas included in an intermediate microeconomics formula sheet? The price elasticity of demand is calculated as (percentage change in quantity demanded) / (percentage change in price), often expressed as $(dQ/dP) (P/Q)$. The price elasticity of supply is similarly $(dQ/dP) (P/Q)$. These formulas help analyze responsiveness of quantity to price changes. How is the consumer surplus formula represented in intermediate microeconomics? Consumer surplus is calculated as the area under the demand curve and above the market price, typically: $\text{Consumer Surplus} = 0.5 (Q) (P_{\max} - P)$, where Q is the equilibrium quantity, $P_{\max}$ is the maximum willingness to pay, and P is the market price. What is the formula for calculating the marginal utility per dollar spent? The marginal utility per dollar is given by MU_x / P_x for good x , where MU_x is the marginal utility of the good and P_x is its price. Consumers maximize utility when $MU_x / P_x = MU_y / P_y$ for all goods. How are the concepts of total, average, and marginal cost expressed in the formula sheet? Total cost (TC) is the sum of fixed and variable costs. Average cost (AC) is TC divided by quantity (Q), i.e., $AC = TC/Q$. Marginal cost (MC) is the derivative of total cost with respect to quantity, $MC = d(TC)/dQ$. What is the formula for profit maximization in perfect competition? Profit maximization occurs when marginal cost equals marginal revenue, so the formula is: $MR = MC$. In perfect competition, MR equals price (P), so firms produce where $P = MC$. How does the formula for consumer utility maximization relate to budget constraints? Consumers maximize utility by choosing quantities that satisfy the condition $MU_x / P_x = MU_y / P_y$, subject to their budget constraint: $P_x Q_x + P_y Q_y = \text{Income}$. The optimal bundle occurs where the budget line is tangent to an indifference curve.
