Geographical Overview of the Himalayan Region

The Formation and Extent of the Himalayas

The Himalayas are among the youngest mountain ranges on Earth, formed approximately 50 million years ago due to the collision between the Indian Plate and the Eurasian Plate. This tectonic activity continues today, causing frequent earthquakes and uplifting the mountains further. The range stretches around 2,400 kilometers (1,500 miles) across five countries: India, Nepal, Bhutan, China (Tibet Autonomous Region), and Pakistan.

Key geographical features include:

- High peaks, including Mount Everest (8,848 meters), the tallest mountain in the world.
- Glaciers covering an area estimated at over 15,000 square kilometers.
- Deep valleys, such as the Kali Gandaki Gorge, considered one of the world's deepest.
- Plateaus and high-altitude plains, like the Tibetan Plateau, often called "the Roof of the World."

Topography and Climate Variations

The terrain varies significantly from subtropical plains at the southern foothills to icy peaks at the highest elevations. This variation results in diverse climates:

- Subtropical climate at the southern plains and foothills.
- Alpine climate in the mid-hills, with cooler temperatures and varied vegetation.
- Arctic climate at the highest peaks, with permanent snow and glaciers.

These climatic zones influence the flora and fauna, human settlement patterns, and cultural practices across the region.
