- Heat of hydration
- Chemical composition and constituents
- Specific gravity
- Loss on ignition

Understanding these tests is crucial for manufacturers, quality inspectors, and structural engineers to guarantee that cement meets the required standards for safety and performance.

Physical Tests of Cement as per EN 196

Physical tests primarily assess the physical characteristics that influence the handling, mixing, and performance of cement in concrete.

1. Fineness of Cement (EN 196-6)

Objective: To determine the particle size distribution of cement particles.

Importance: Fineness influences the rate of hydration, strength development, and workability of cement paste.

Testing Method:

- **Blain Air Permeability Test:** Measures the specific surface area by passing air through a cement bed and calculating based on permeability.
- **Sieve Analysis:** Uses a set of standard sieves (e.g., IS Sieve No. 90 and 90 μ m) to determine the percentage of cement passing through.

Procedure:

- For the Blaine method, a sample is prepared, and the air permeability apparatus is used to measure the permeability, then calculations are made to derive the specific surface area.
- For sieve analysis, about 100 grams of cement is sieved, and the retained and passing amounts are measured to calculate the fineness.

Acceptance Criteria: Typically, fineness should be between 250 and 380 m^2/kg , depending on the cement type.

2. Consistency of Cement (EN 196-3)

Objective: To determine the amount of water required to produce a cement paste of standard consistency.

Importance: Consistency influences workability and setting times.

Testing Method:

- **Vicat Apparatus Test:** A standard paste is prepared by mixing cement and water at varying water-cement ratios until a specific penetration depth is achieved (usually 10 mm).

Procedure:

- Mix cement with water to create a paste.
- Use the Vicat apparatus to test the paste's penetration.
- Adjust water content until the desired penetration depth is achieved; record this water content as the consistency.

Practical Note: The standard consistency is typically around 26-33% water by weight of cement.
