Question What are key clinical features to assess in a patient presenting with suspected urinary tract infection during an OSCE? Key features include dysuria, urgency, frequency, suprapubic pain, hematuria, and possible systemic symptoms like fever. A focused history and physical exam, including abdominal and genital examination, are essential for diagnosis. How should a urological clinical case involving a suspected testicular torsion be approached in an OSCE setting? The approach involves taking a detailed history of sudden-onset scrotal pain, assessing for nausea or vomiting, examining for swelling, tenderness, and abnormal lie of the testicle, and noting the absence of cremasteric reflex. Urgent surgical consultation is necessary if torsion is suspected. What are the typical findings in a patient with benign prostatic hyperplasia (BPH) during a urological OSCE station? Findings include a smooth, enlarged prostate on digital rectal examination, urinary hesitancy, weak stream, nocturia, and incomplete bladder emptying. It's important to differentiate BPH from other causes of lower urinary tract symptoms. How can you differentiate between urinary incontinence types in a clinical OSCE scenario? Differentiation involves taking a detailed history to identify stress incontinence (leak with coughing/laughing), urge incontinence (sudden strong urge), overflow incontinence (dribbling due to retention), and mixed types. Physical exam and post-void residual measurement aid diagnosis. What are the key points in managing a patient with suspected kidney stone during an OSCE station? Management includes obtaining a detailed history of pain characteristics, hematuria, and previous episodes; performing abdominal and flank examinations; arranging imaging (like ultrasound or CT scan); providing pain control, hydration, and considering referral for urological intervention if needed. What questions should be asked in a history for suspected prostate cancer in an OSCE exam? Questions should include urinary symptoms (hesitancy, weak stream), hematuria, pain in the back or pelvis, weight loss, history of urinary infections, and family history of prostate cancer. A digital rectal exam and PSA testing are also important components.
