The fundamental balance condition in the Anderson Bridge is expressed as:

$\{$

$$L_x = R_2 R_1 C \quad \text{(after rearranging and considering the reactive components)}$$

$\}$

The precise formula depends on the specific configuration, but the key idea is that the known resistor, capacitor, and variable resistor are adjusted until the galvanometer indicates zero current, indicating a balanced bridge.

Step-by-Step Procedure Using the Anderson Bridge

- Set up the circuit: Connect all components according to the block diagram, ensuring correct placements of the unknown inductor, resistors, capacitor, and galvanometer.
- Apply AC supply: Turn on the power supply at a suitable frequency.

- Adjust the variable resistor (VR): Vary VR until the galvanometer shows zero deflection, indicating a null condition.
- Record the readings: Note the values of R1, R2, C, VR, and the frequency of the AC supply.
- Calculate the unknown inductance (Lx): Use the balanced condition formula:

\[

$$L_x = \frac{R_2 R_1}{C}$$

\]

or the more precise formula derived from the detailed balance condition, accounting for the circuit's specifics.
