Common Pre-Lab Questions and Suggested Answers for Experiment 19

Below are typical pre-lab questions associated with Experiment 19, along with detailed answers to guide students.

1. What is the main objective of this experiment?

Answer:

The primary objective of Experiment 19 is to investigate the factors affecting the rate of a specific chemical reaction, such as how concentration or temperature influences reaction speed. The experiment aims to determine the reaction order and rate constant, and to analyze the activation energy using the Arrhenius equation.

2. Describe the chemical reaction you will study.

Answer:

The reaction involves the transformation of reactants A and B into products, represented by the general equation:

The specific reactants and conditions will be provided in the lab manual, but typically, this involves a reaction that can be monitored spectrophotometrically or via titration to measure concentration changes over time.

3. What are the variables in this experiment, and which ones are controlled?

Answer:

Variables in Experiment 19 include:

- Independent variables: Temperature, concentration of reactants, presence of catalysts
- Dependent variable: Reaction rate or rate constant
- Controlled variables: Volume of solutions, pH, pressure (if applicable), and experimental environment conditions

4. How will you measure the reaction rate?

Answer:

Reaction rate will be measured by monitoring the change in concentration of a reactant or product over time. This can be achieved through spectrophotometric measurements of absorbance at a specific wavelength or titration at different time intervals to determine concentration changes.

5. Explain how the Arrhenius equation relates to this experiment.

Answer:

The Arrhenius equation links the rate constant (k) to temperature (T) and activation energy (E_a):

$$k = A e^{(-E_a/RT)}$$

By conducting the reaction at different temperatures, students can calculate the rate constants and plot $\ln(k)$ versus $1/T$ to determine E_a and A , providing insights into the energy barrier of the reaction.

6. What safety precautions should be taken during this experiment?

Answer:

Safety precautions include:

- Wearing lab coats, gloves, and safety goggles at all times
- Handling chemicals carefully, especially if acids, bases, or toxic compounds are involved
- Working in a well-ventilated area or under a fume hood when necessary
- Properly disposing of chemical waste according to the instructor's guidelines

7. What equipment will you use, and how will you calibrate it?

Answer:

Equipment may include:

- Spectrophotometer for absorbance measurements
- Pipettes and burettes for precise volume measurements
- Water bath for maintaining specific temperatures
- Calibration involves using standards with known concentrations or absorbance to ensure accurate readings.

8. How do you determine the reaction order from your data?

Answer:

Reaction order can be determined by analyzing how the initial rate changes with varying reactant concentrations. Plotting data according to integrated rate laws (zero, first, or second order) and checking which produces a linear relationship helps identify the reaction order.

Additional Tips for Success in Experiment 19

- Review Theoretical Concepts: Make sure you understand the principles of reaction kinetics and the Arrhenius equation before coming to the lab.
