Question What are the main types of chemical bonds studied in grade 10 chemistry? The main types of chemical bonds are ionic bonds, covalent bonds, and metallic bonds. Ionic bonds involve the transfer of electrons between metals and non-metals, covalent bonds involve sharing electrons between non-metals, and metallic bonds occur between metal atoms sharing a 'sea of electrons'. **Answer** How do you balance a chemical equation? To balance a chemical equation, you add coefficients in front of chemical formulas to ensure the same number of each type of atom on both sides of the equation. The process involves adjusting coefficients systematically while maintaining the conservation of mass. What is the difference between physical and chemical changes? A physical change alters the form or appearance of a substance without changing its chemical composition (e.g., melting, boiling), while a chemical change involves a new substance forming with different properties (e.g., combustion, rusting). What are acids and bases, and how are they identified in experiments? Acids are substances that taste sour and turn blue litmus paper red; they release H^+ ions in solution. Bases are substances that taste bitter, feel slippery, and turn red litmus paper blue. pH indicators like litmus paper or pH meters are used to identify acids and bases. Explain the concept of molar mass and how it is calculated. Molar mass is the mass of one mole of a substance, expressed in grams per mole (g/mol). It is calculated by summing the atomic masses of all atoms in a chemical formula based on the periodic table. What is the periodic table, and why is it important in chemistry? The periodic table organizes all known chemical elements based on

increasing atomic number, showing periodic trends and element groups. It is important because it helps predict element properties, reactivity, and relationships between elements.
